## BEST AVAILABL

Defective images within this document are accurate representathe original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

## IMAGES ARE BEST AVAILABLE COPY.

As rescanning documents will not correct images, please do not report the images to the Image Problem Mailbox.

Pharmaceutical compositions containing this ligand may be used as a pitultary function modulator, a central nervous system modulator or a pancreatic function modulator. This ligand could have specific applications as a prophylactic or therapeutic agent for dementia, depression, hyperkinetic syndrome, disturbance of consciousness, anxiety syndrome, schizophronia, trauma, growth hormone secretory disease, hyper-and polyphagia, hyperprolactinaemia, diabetes, cancer, pancreatitis, renal disease, hyperispidaemia, hypercholesterolaemia, hyperglyceridaemia, hyperprolactinaemia, diabetes, cancer, pancreatitis, renal disease, hyper-syndrome, neurosis, asthma, rheumatoid arthritis, spinal injury, transient brain ischaemia, epilepsy, amylotrophic lateral scierosis, acute myocardial infarction, infaritility, spinocerebellar degeneration, oligogalactia. Assays can also be developed to screen compounds which are activation of the G protein-curied recenter for the G protein-curied recenter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents a rat type ligand fragment. It is used in the course of the invention. The specification describes an agent for modulating prolactin secretion which comprises a ligand polypeptide or a sait, for a g protein-coupled receptor (GPCR) protein. The agents for promoting prolactin secretion can be used for protein. The agents for promoting prolactin secretion can be used for treating or preventing hypocovarianism, gonecyst cacogenesis, menopausal syndrome, euthyroid or hypometabolism. They can by used for promoting lactation in a domestic mammai and as an aphrodisiac. The agents for inhibiting prolactin secretion can be used for treating or preventing plactating prolactinomal infeatility, impotence, amenorabethy, autolumune disease, prolactinoma, infeatility, impotence, amenorabethy agaiactorrhea, acromegaly, Chiari-Frommel syndrome, Argonz-dei Castilo syndrome, Forbes-Albright syndrome, lymphoma, Sheehan syndrome or dyszoospermia. The inhibitory agents can also be used as contraceptives. The agents for modulating placental function can be used for treating or preventing conformal saccharometabolism, abnormal informacy agents or controls.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              senile dementia, cerebrovascular dementia, and dementia associated with: genealogical disorders (e.g. Alzheimer's disease, Parkinson's disease), infectious diseases (e.g. Creutzfeldt-Jakob's), endocrine or metabolic disease or toxicosis (e.g. hypothyroidism, vitamin Bl2 deficiency, alcoholism, infoxication by drugs, metal and organic compounds), tumourigenic diseases (e.g. brain tumour), traumantic diseases (e.g. chronic diseases (e.g. brain tumour), traumantic diseases (e.g. chronic consciousness. It is also useful for prevention and treatment of diseases associated with prolactin hypo and hypersecretion respectively, including: hyperprolactinaemia, pitulitary adenoma, chests cancer, infertility, impotence and succimmune disease (hypersecretion disorders), and seminal vesicle hypoplasia, menopausal syndrome and renal fallure (hyposecretion disorders). The 1972 polypeptide/amide is also useful for study of the prolactin secretory function or as a lactogogue in mammalian farm animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches

A method suitable for commercial high-level production of 19P2L comprises expressing the ligand in host cells as a recombinant fusion protein e.g. with human basic fibroblast growth factor (see AAVB3794-95) that has been modified to include an N-terminal cysteine residue. The ligand is released from the fusion by cyanylation followed by ammonolysis. 19P2L has prolactin secretion-stimulating and (at high doses) prolactin secretion-inhibiting properties. It can be used in the treatment and prevention of various diseases including:

sequence. The polypeptide is a ligard for the G-protein coupled orphan or creceptor designated GPR10 (human) or UHR-1 (rat). Cells transformed with executor containing the ligand polypeptide encoding DNA are used to comproduce a recombinant ligand polypeptide. The ligand polypeptide, and its of fragments, modulate function of the pituitary, central nervous system, cancers and other tissues and can be used to screen for agents that modulate binding of the polypeptide to the receptor; to quantify the camount of receptor in a sample and to raise antibodies. They may also be used therapeutically, e.g. to treat senile dementia, Alzheimer's, cused therapeutically, e.g. to treat senile dementia, Alzheimer's, comparing the parkinson's or Humtington's disease; Creutzfeld-Jakob disease; poisoning by heavy metals or drugs; diabetes; schizophrenia, disorders of growth compone secretion; cancer; rheumatold arthritis, epilepsy and many cothers, also to improve post-operative nutritional atatus and as concertions of the surging the ligand polypeptide encoding DNA or its mutein are used to study the function of the polypeptide encoding coffice in the polypeptide encoding the ligand polypeptide. The polypeptide encoding coffice in the polypeptide in the polypeptide encoding the ligand polypeptide encoding coffice and primers; to identify related sequences, in receptor-binding assays; coffice of production of Ab and antisers; in drug development; for gene therapy and condition of the and antisers; in drug development; for gene therapy and an total and antisers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a murine pituitary-derived ligand polypeptide which is a ligand for the G-protein coupled orphan receptor designated GC GPRIO (human) or UHR-1 (rat). Cells transformed with a vector containing the ligand polypeptide encoding DNA are used to produce a recombinant CC function of the pituitary, central nervous system, pancreas and other CC tissues and can be used to screen for agents that modulate binding of the polypeptide to the receptor; to quantify the amount of receptor in a sample and to raise antibodies. They may also be used therapeuticaily, CC e.g. to treat sealle dementia; Albelmer's, Parkinson's or Huntington's CC disease; Creutzfeid-Jakob disease; poisoning by heavy metals or drugs; C1 disease; Creutzfeid-Jakob disease; poisoning by heavy metals or drugs; C1 disease; chizophrenia; disorders of growth hormone secretion; cancer; rheumatoid arthritis, epliepsy and many others, also to improve post-CC operative nutritional status and as vasopressor. Transgenic animals c carrying the ligand polypeptide encoding DNA or its mutein are used to study the function of the polypeptide-expressing genes, as models of CC disease, for drug screening and as source of cell lines. The ligand CC polypeptide DNA is used as a source of probes and primers; to identify crelated sequences; in receptor-binding assays; for production of Ab and CC cantisers; in receptor-binding assays; for production of Ab and CC cantisers; in a sequences AAM95174 to AAM95178 represent antigenic cepiotops which can be used for the preparation of anti-ligand polypeptide contributed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match 91.

                                                                                문
                                                                                                                                                                                                                                                         This invention describes a novei oxytocin secretion-regulating agent which contains a ligand peptide or its sait for the G protein-coupled receptor protein. It is useful in the form of drugs for ameliorating, preventing and treating diseases relating to oxytocin secretion e.g. weak pains and atonic bleeding, before and after expuision of placenta uterine recovery failure, caesarean section, stoppage of artificial fertilization or galactostasis and is also applicable in vetetinary medicine for promoting milk production in cow, goat and pig. This sequence represents a rat peptide which acts as an oxytocin secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI;

The method comprises cell-free and/or cell-based assays that identify compounds which bind to and/or activate or inhibit the activity of GPRIO, a G protein-coupled receptor. These assays are then followed by an in vivo assay of the effect of the compound on feeding behaviour, body weight or metabolic rate in a mammal. Prolactin-releasing peptide (PrRP, AAY87504) is a ligand of GPRIO. Binding of PrRP to GPRIO stimulates a signal transduction cascade, which results in an increase in food intake. Compounds identified using the method of the invention are useful for the modulation of body weight. Antagonists of GPRIO can be used to treat obesity, while GPRIO agonists can be used to treat obesity, while GPRIO agonists can be used to treat cachexia. The present sequence represents rat PrRP.
The invention provides a monoclonal antibody which has a specific reaction with the part peptide of the C-terminal of 1992 ligand or its derivative. The antibodies can be used in diagnosis or to treat or prevent diseases associated with abnormality in the pituitary function regulatory mechanism (e.g. promotion of prolactin secretion), central nervous regulatory mechanism, and pancreatic function regulatory mechanism, and pancreatic function applied in clarifying the physiological functions of the ligand and its derivative
                                                                                                                                                         New monoclonal antibodies, studying diseases related :

                                                                                                              The present sequence describes a method of controlling the secretion of corticotrophin releasing hormone (CRH), involving the use of a G protein receptor ligand. This can be used to control the secretion of CRH and is useful as an analyesic or for treating, preventing or ancitorating diseases associated with CRH secretion such as hyperaldosteronism, hypercortisolaemia, secondary or chronic hypoadrenocorticism, Addison's disease (including boredom, nausea, pigmentation, hypogonadism, hair loss, and hypotension), adrenal gland hypofunction and obesity. The present sequence is a peptide used in the exemplification of the

                                                                                                                                                                                                                                              The present invention describes a modified therapeutic peptide (I)
C comprising a therapeutically active amino acid region (III) and a
C reactive group (II) (e.g. succinimity) and malelmido groups) attached to
a less therapeutically active amino scid region (IV), which covalently
C bonds with amino/hydroxyl/thlol groups on blood components to form a
C peptidase stabilised therapeutic peptide composed of 3-50 amino acids.
C (I) are useful for modifying therapeutic peptides e.g. hormones, growth
factors and neurotransmitters, to protect them from peptidase activity
in vivo for the treatment of various disorders. Endogenous therapeutic
Deptides are not sultable as drug candidates as they require frequent
administration due to rapid degradation by peptidases in the body.
Modifying snd attaching therapeutic peptides to slbumin prevents or
reduces the action of peptidases to increase length of activity (haif
life) and specificity as bonding to large molecules decreases
AhB90829 to AhB92441 represent peptides which can be used in the
exemplification of the present invention.

                                                                                                         Ş
                                                                                                                                                                                                                     cc ligand polypeptide corresponding to amino acid residues 22 to 53 of the sequence represented in AAW31383 and is used in an assay to monitor cligand binding to the G protein-coupled receptor protein. Pharmaceutical compositions containing this ligand may be used as a pituitary function modulator. A central nervous system modulator or a pancreatic function modulator. This ligand could have specific applications as a syndrome, in the rapputic agent for dementla, depression, hyperkinetic syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, trauma, growth hormone secretory disease, hyper and polyphagla, ct hyperlipidaemia, hypercholesterolaemia, hyperalyogridsemia, furner syndrome, neurosis, asthma, rheumatold arthritis, spinal injury, translent brain ischaemia, epilepsy, amylotrophic lateral sclerosis, acute myocardial infarction, infertility, spinocerebeliar degeneration, bone fracture, trauma, atopic dermatitis, osteoporosis and/or calpopalactia. Assays can also be developed to screen compounds which are capable of altering the binding activity of the ligand affecting activation of the G protein-coupled receptor protein.
                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                              Query Match
                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel oxytocin secretion-regulating agent which contains a ligand peptide or its salt for the 6 protein-coupled receptor protein. It is useful in the form of drugs for ameliorating, preventing and treating diseases relating to oxytocin secretion e.g. weak pains and atonic bleeding, before and after expulsion of placenta, uterine recovery failure, caesarean section, stoppage of artificial fertilization or galactostasis and is also applicable in veterinary medicine for promoting milk production in cow, yout and pig. This sequence represents a rat peptide which acts as an oxytocin secretion

This can be used to control the secretion of CRH and is useful as an analyssic or for treating, preventing or ameliorating diseases associated with CRH secretion such as hyperaldosteronism, hypercroticolated, secondary or chronic hypoadrenocorticism, Addison's disease (Including boredom, nausea, pigmentation, hypogonadism, hair loss, and hypotension), adrenai gland hypofunction and obesity. The present sequence is a peptide used in the exemplification of the

Pharmaceutical CC compositions containing this ligand may be used as a pituitary function CC modulator. This ligand could have specific applications as a CC prophylactic or therapeutic agent for dementia, depression, hyperkinetic applications, growth hormone secretory disease, hyper- and polyphagia, CC hyperlipidaemia, hypercholesterolaemia, hypergiyceridaemia, cC Turner's syndrome, neurosis, asthma, rheumatoid arthritis, spinal injury, CC transient brain ischaemia, epilepsy, amylotrophic lateral sclerosis, acute myocardial infarction, infertility, apinocerebellar degeneration, CC consense and polyphagia decute myocardial infarction, infertility, apinocerebellar degeneration, CC consense and polyphic lateral sclerosis, acute myocardial infarction, infertility, apinocerebellar degeneration, CC consense and polyphic lateral sclerosis, acute myocardial infarction, infertility, apinocerebellar degeneration, CC consense and polyphic lateral sclerosis, acute myocardial infarction, infertility, apinocerebellar degeneration, CC consense and polyphic lateral sclerosis, acute myocardial infarction, infertility, apinocerebellar degeneration, CC consense and polyphic lateral sclerosis and/or colleged to screen compounds which are capable of altering the binding activity of the ligand affecting CC activation of the G protein-coupled receptor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

```

Disclosure; Page 58; 72pp; Japanese

This invention describes a novel oxytocin secretion-regulating agent which contains a ligand peptide or its salt for the G protein-coupled receptor protein. It is useful in the form of drugs for ameliorating, preventing and treating diseases relating to oxytocin secretion e.g. weak pains and atonic bleeding, before and after expuision of placenta, uterine recovery failure, caesarean secretion, atoppage of srtificial fertilization or galactostasis and is also applicable in veterinary medicine for promoting milk production in cow, goat and pig. This promoter. aequence represents a rat peptide which acta as an oxytocin aecretion

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a peptide fragment from a novel human type cligand polypeptide corresponding to amino acid residues 23 to 53 of the sequence represented in AAM31390 and is used in an assay to monitor ligand binding to the 6 protein-coupled receptor protein. Pharmaceutical compositions containing this ligand may be used as a pituitary function modulator. This ligand could have specific applications as a prophylactic or therapeutic agent for dementia, depression, hyperkinetic syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, trauma, growth hormone secretory disease, hyper- and polyphagia, hyperlipidaemia, hypercholesteroiaemia, hyperglyceridaemia, hypercholesteroiaemia, hyperglyceridaemia, hyperprolactinaemia, diabetes, cancer, pancreatitis, renal disease, hyper- syndrome, neurosis, asthma, rheumatoid arthritis, spinal injury, transient brain ischaemia, epilepsy, amylotrophic lateral sclerosis, acute myocardial infarction, infertility, spinocerebeiiar degeneration, oligogalactia. Assays can also be developed to screen compounds which are capable of altering the binding activity of the ligand affecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC ligand polypeptide corresponding to amino acid residues 22 to 52 of the CC sequence represented in AAW31383 and is used in an assay to monitor CC ligand binding to the G protein-coupled receptor protein. Pharmaccutical CC chapositions containing this ligand may be used as a pituitary function CC modulator. This ligand could have specific applications as a CC prophylactic or therapeutic agent for dementia, depression, hyperkinetic cc syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, CC trauma, growth hormone secretory disease, hyper-and polyphagia, CC hyperlipidaemia, hypercholesterolaemia, hypergiyceridaemia, cc transient brain ischaemia, spilepsy, amyiotrophic lateral sclerosis, acute myocardial infarction, infertility, spinocerebellar degeneration, CC dispession to the infarction, infertility, spinocerebellar degeneration, CC coule myocardial infarction, infertility, spinocerebellar degeneration, CC dispession to the infarction, infertility, spinocerebellar degeneration, CC dispession to the coule of active transies can also be developed to screen compounds which are CC capable of altering the binding activity of the ligand affecting activation of the G protein-coupled receptor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAW97233
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

It can be present sequence represents a human type ligand fragment. It is seen to the course of the invention. The specification describes a great for modulating prolactin secretion which compled receptors defor a sent for modulating prolactin secretion can be unequised for great for promoting prolactin secretion can be unequised for protein. The agents for promoting prolacting the greating or preventing hypometabolism. They can by used for promoting protein secretion as an aphrot reating or preventing to result in a domestic mammal and as used for the agents for considering prolactin secretion can be used for the autoinmune disease, inhibiting prolactin secretion can memoribe a succious parts for prolacting prolacting promome, and a succious succious and infertility, indome, argonz-del castilo syndrome, argonz-del castilo syndrome or preventing concessively. Chiarity from the promome, argonz-del casting or preventing concessively the syndrome, and as contracting or preventing the inhibitory agents can also be used for tracting or preventing the process of the inhibitory agents and process of tracting or preventing the process of the inhibitory agents and process of tracting or preventing considering placents for the inhibitory agents and process of tracting or preventing the process of the inhibitory agents and process of the process of the inhibitory agents and process of the process of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC This represents the matured murlne pitultary-derived ligand polypeptide CC sequence. The polypeptide is a ligand for the G-protein coupled orphan CC receptor designated GPR10 (human) or UHR-1 (rat). Cells transformed with CC a vector containing the ligand polypeptide. The ligand polypeptide encoding DNA are used to CC fragments, modulate function of the pitultary, central nervous system, CC produce a recombinant ligand polypeptide. The ligand polypeptide, and its CC modulate binding of the polypeptide to screen for agents that CC modulate binding of the polypeptide to the receptor; to quantify the CC amount of receptor in a sample and to raise antibodies. They may also be used therapeutically, e.g. to treat senile dementia; Alzheimer's, CC Parkinson's or Huntington's diseases: Creutzfeld-Jakob disease; poisoning the heavy metals or drugs; dlabetes; schizophrenia; disorders of growth CC hormone secretion; cancer; rheumatoid arthritis, epilepsy and many CC others, also to improve post-operative nutritional status and as conversed or its mutein are used to study the function of the polypeptide encoding CC DNA or its mutein are used to study the function of the polypeptide. CC expressing genes, as models of disease, for drug screening and as source of call lines. The ligand polypeptide DNA is used as a source of probes and to develop transgenic animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

diseases; Creutzfeld-Jakob disease; poisoning by heavy metals or drugs; diabetes; schizophrenia; disorders of growth hormone secretion; cancer; rheumatold arthritis, epllepsy and many others, also to improve post-operative nutritional status and as vasopressor. Transgenic animals carrying the ligand polypeptide encoding DNA or its mutein are used to study the function of the polypeptide-expressing genes, as models of disease, for drug screening and as source of cell lines. The ligand polypeptide DNA is used as a source of probes and primers; to identify related sequences; in receptor-binding assays; for production of Ab and antisera; in drug development; for gene therapy and to develop transgenic animals. Sequences AAM95174 to AAW95178 represent antigenic epiotpes which can be used for the preparation of anti-ligand polypeptide antibody.
                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a murine pituitary-derived ligand polypeptide which is a ligand for the G-protein coupled orphan receptor designated GPR10 (human) or UHR-1 (rat). Cells transformed with a vector containing the ligand polypeptide encoding DNA are used to produce a recombinant ligand polypeptide. The ligand polypeptide, and its fragments, modulate function of the pituitary, central nervous system, pancreas and other tissues and can be used to scene for agents the amount of receptor in a sample and to raise antibodies. They may also be used therapeutically, e.g. to treat senile dementia; Alzheimer's, Parkingon's or Huntington's

It is useful in the form of drugs for ameliorating, preventing and treating diseases relating to oxytocin secretion e.g. weak pains and atonic bleeding, before and after expulsion of placenta, uterine recovery failure, caesarean section, stoppage of artificial fertilization or galactostasis and is also applicable in veterinary medicine for promoting milk production in cow, goat and pig. This seguence represents a rat peptide which acts as an oxytocin secretion
                          Physiologically-active polypeptide recognized as ligand by protein-coupled receptor protein, for promoting secretion as drugs for diseases relating to oxytocin secretion and i

It is useful in the form of drugs for smellocating, preventing and treating diseases relating to oxytocin secretion e.g. weak pains and atonic bleeding, before and after expulsion of placents, uterine recovery failure, caesarean section, stoppage of artificial fertilization or galactostasis and is also applicable in veterinary medicine for promoting milk production in cow, goat and pig. This sequence represents a human peptide which acts as an oxytocin secretion
                                                                                                          Identifying modulators of body weight by a combination of a coor ceil-based assay to identify modulators of GPR10, followed vivo assay for the compounds effect on e.g. feeding behavior.

The invention relates to a method for identifying compounds useful for modulating body weight. The method comprises call-free and/or call-based assays that identify compounds which bind to and/or activate or inhibit the activity of GPRIO, a G protein-coupled receptor. These assays are then followed by an in vivo assay of the effect of the compound on feeding behaviour, body weight or metabolic rate in a mammal. Prolactingleasing peptide (PrRP; AAY87504) is a ligand of GPRIO. Binding of PrRI releasing peptide (PrRP; AAY87504) is a ligand of GPRIO.

                                                                                         The Invention provides a monoclonal antibody which has a specific reaction with the part peptide of the C-terminal of 19P2 ligand or its derivative. The antibodies can be used in diagnosis or to treat or prevent diseases associated with abnormality in the pituitary function regulatory mechanism (e.g. promotion of prolactin secretion), central nervous regulatory mechanism, and pancreatic function regulatory mechanism. The antibody-based immunoassay can also be applied in clarifying the physiological functions of the ligand and its derivative. Sequences ANY49290-302 represent peptide fragments of the 19P2 ligand.
                                                                                                                                                                                                                                                                     WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              to GPR10 stimulates a signal transduction cascade, which results in an increase in food intake. Compounds identified using the method of the invention are useful for the modulation of body weight. Antagonists of GPR10 can be used to treat obesity, while GPR10 agonists can be used to treat obesity, while GPR10 agonists can be used to treat cachexia. The present sequence represents rat PrRP.

                                                                                                                                                                                                                                                                                        The Invention provides a monocional antibody which has a specific reaction with the part peptide of the C-terminal of 19P2 ligand or its derivative. The antibodies can be used in diagnosis or to treat or prevent diseases associated with abnormality in the pituitary function regulatory mechanism (e.g. promotion of projectin secretion), centrai nervous regulatory mechanism, and pancreatic function regulatory mechanism. The antibody-based immunoassay can also be applied in clarifying the physiological functions of the ligand and its derivative. Sequences AAY49290-302 represent peptide fragments of the 19P2 ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI; 2000-039381/03

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence describes a method of controlling the secretion of corticotrophin releasing hormone (CRH), involving the use of a G protein receptor ligand. This can be used to control the secretion of CRH and is useful as an analgesic or for treating, preventing or ameliorating diseases associated with CRH secretion such as hyperaidosteronism, hypercortisolaemia, secondary or chronic hypoadrenocorticism, Addison's disease (including boredom, nausea, pigmentation, hypogonadism, hair ioss, and hypotension), adrenai gland hypofunction and obesity. The present sequence is a peptide used in the exempilification of the

This can be used to control the secretion of CRH and is useful as an analyseste or for treating, preventing or ameliorating diseases associated with CRH secretion such as hyperaidosteronism, hypercortisolaemia, secondary or chronic hypodrenocorticism, Addison's disease (including boredom, nausea, pigmentation, hypogonadism, hair loss, and hypotension), adrenal gland hypofunction and obesity. The present sequence is a peptide used in the exemplification of the

         peptide for G protein-coupled receptor - acts by modulating
on in the central nervous system, pancreas and pituitary giand
```

This sequence represents a peptide fragment from a novel human type collegand polypeptide corresponding to amino acid residues 23 to 53 of the CC sequence represented in AAW31390 and is used in an assay to monitor compositions containing this ligand may be used as a pituitary monitor compositions containing this ligand may be used as a pituitary function composition. This ligand revous system modulator or a pancreatic function composition and could have specific applications as a private function composition of the could have specific applications as a private function composition of the could have specific applications as a private function composition of the could have specific applications as a private function composition of the consciousness, antiety syndrome, hyperkinetic compositions, disturbance of consciousness, antiety syndrome, schizophrenia, composition of the consciousness, antiety syndrome, schizophrenia, composition, hypercholesterolaemia, hyperglyceridaemia, composition, partiety, asthma, rheumatoid arthritis, spinal injury, composition, composition, atopic dermatitity, spinocerebellar degeneration, configuration of altering the binding activity of the ligand affecting activation of the G protein-coupled receptor protein.

Use of G protein-coupled receptor ligands - for modulating prolactin serretion or placental function, e.g. for treating menopausal syndrome, tumours, autoimmune disease or abnormal pregnancy

Claim 3; Page 159; 241pp; English.

The present sequence represents a human type ligand fragment. It colored is used in the course of the invention. The specification describes of ligand polypeptide or a salt, for a grotein which comprises a salt, for a grotein coupled receptor (GPCR) or treating or preventing hypovarianism, generating secretion can be used for coupled receptor (GPCR) or syndrome, enthyroid or hypometabolism. They can by used for promoting contributing prolactin secretion can be used for inhibiting prolactin secretion can be used for treating or preventing contributing prolactin secretion can be used for treating or preventing contributing prolactinoma, infertility, impotence, amenoriopathy, autoimmuna disease, contributions, chiari-trommel syndrome, amenoriopathy, autoimmuna disease, condulating placental function can be used for treating or preventing condulating placental function can be used so contraceptives. The agents for condulating placental function can be used as contraceptives. The agents for choriccarcinoma, hydatid moie, intuption moie, aboutton, unthrifty fetus, abnormal saccharometabolism, abnormal lipidmetabolism or oxytocla.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ammonolysia. 1971 has prolactin secretion atimulating and (at CC high doses) prolactin secretion inhibiting properties. It can be used in the treatment and prevention of various diseases. It can be considered that the treatment and prevention of various diseases. It can be senile dementia, cerebrovascular dementia, and dementia associated with: genealogical disorders (e.g. Alzheimer's disease, Parkinson's consease, Pick's disease, Huntington's disease, Infectious diseases of the consecution of the properties or metabolic disease or consciousis (e.g. hypothyroidism, vitamin Bl2 deficiency, alcoholism, contextion by druga, metal and organic compounds), tumourlgenic contextication by druga, metal and organic compounds; tumourlgenic context of the consciousness and treatment of consciousness. It is also useful for prevention and treatment of consciousness. It is also useful for prevention and treatment of consciousness. It is also useful for prevention and treatment of consciousness associated with prolactin hypo and hypersecretion consciousness, infertility, impotence and autoimmune disease breat cancer, infertility, impotence and autoimmune disease. The laps polypeptide/amide is also useful as a test categority of the prolactin secretory function or as a disorders). The laps polypeptide/amide is also useful as a test cancer in mammalian farm animals.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       which contains a ligand peptide or its salt for the G protein coupled receptor protein. It is useful in the form of drugs for ameliorating, preventing and treating diseases relating to oxytocin secretion e.g. weak pains and atonic bleeding, before and after expulsion of placenta, uterine recovery failure, caesarean section, stoppage of artificial fertilization or galactostasis and is also applicable in veterinary medicine for promoting milk production in cow, goat and pig. This sequence represents a human peptide which acts as an oxytocin secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Physiologically-active polypeptide recognized as ligand by G protein-coupled receptor protein, for promoting secretion of oxytocin, as drugs for diseases relating to oxytocin secretion and in veterinary medicine
                                                                                      New monoclonal antibodies, u

Ö

The invention provides a monoclonal antibody which has a apecific reaction with the part peptide of the C-terminal of 1992 ligand or derivative. The antibodies can be used in diagnosia or to treat or prevent diseases associated with abnormality in the pituitary funct regulatory mechanism (e.g. promotion of prolactin accretion), centi

                                                                                                                                   The present sequence describes a method of controlling the secretion of corticotrophin releasing hormone (CRH), involving the use of a G protein receptor ligand. This can be used to control the secretion of CRH and is useful as an analgesic or for treating, preventing or ameliorating diseases associated with CRH secretion such as hyperaldosteronism, hypercortisoidemia, secondary or chronic hypodremocorticism, Addison's disease (including boredom, nausea, pigmentation, hypogonadism, hair loss, and hypotension), adrenal gland hypofunction and obesity. The present sequence is a peptide used in the exemplification of the
                                                                                                                                                                                                                                                                    Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                nervous regulatory mechanism, and pancreatic function regulatory mechanism. The antibody-based immunoassay can also be applied in clarifying the physiological functions of the ligand and its derivative sequences AAY49290-302 represent peptide fragments of the 19P2 ligand.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Modifying
peptidase
                                                                                                                                                                                                                                                                      bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succilindidy) and maleimide groups) attached a less therapeutically active amino acid region (IV), which covalently
                                                                                                                                                                                         intracellular uptake and interference with physiological procamb90829 to AAB92441 represent peptides which can be used in exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                protection; endogenous therapeutic peptide; peptidase; conjugation;

                                                                             S
                                                                                                                                                                                                                 This sequence represents a peptide fragment from a novel human type illigand polypeptide corresponding to amino acid residues 23 to 54 of the sequence represented in AAW31330 and is used in an assay to monitor illigand binding to the G protein-coupled receptor protein Paramaceutical compositions containing this ligand may be used as a pituitary function modulator, a central nervous system modulator or a pancreatic function commodulator, a central nervous system modulator or a pancreatic function modulator. This ligand could have specific applications as a prophylactic or therapeutic agent for dementia, depression, hyperkinetic prophylactic or therapeutic agent for dementia, depression, hyperkinetic syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, trauma, growth hormone secretory disease, hyper and polyphagia, for hyperprolactinaemia, diabetes, cancer, pancreatitis, renal disease, hyperis syndrome, neurosis, asthma, rheumatoid arthritis, spinal injury, cransient brain ischaemia, epilepsy, amyiotrophic lateral sclerosis, acute myocardial infarction, infertility, spinocerabellar degeneration, consense and/or consolusatia. Assays can also be developed to screen compounds which are capable of altering the binding activity of the ligand affecting

It is useful in the form of drugs for ameliorating, preventing and treating diseases relating to oxytocin secretion e.g. weak pains and atonic bleeding, before and after expulsion of placenta, uterine recovery failure, caesarean section, stoppage of artificial fertilization or galactostasis and is also applicable in veterinary medicine for promoting milk production in cow, goat and plg. This sequence represents a human peptide which acts as an oxytocin secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Physiologically-active polypeptide recognized as ligand by G protein-coupled receptor protein, for promoting secretion of oxytocin, as drugs for diseases relating to oxytocin secretion and in veterinary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; oxytocin secretion promoter; G protein-coupled receptor protein; treatment; disease; pain; atonic bleeding; uterine recovery failure; co caesarean section; artificial fertilization; galactostasis; goat; plg;

CC Injury polypeptide corresponding to amino acid residues 23 to 55 of the CC ligand polypeptide corresponding to amino acid residues 23 to 55 of the CC sequence represented in AAW31330 and is used in an assay to monitor CC ligand binding to the G protein-coupled receptor protein. Pharmaceutical CC compositions containing this ligand may be used as a pituitary function CC modulator, a central nervous system modulator or a pancreatic function CC modulator. This ligand could have specific applications as a CC prophylactic or therapeutic agent for dementia, depression, hyperkinetic syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, CC trauma, growth hormone secretory disease, hyper- and polyphagia, CC hyperlipidaemia, hypercholesterolaemia, hyperglyceridaemia, hypergrolactinaemia, diabetes, cancer, pancreatitis, renal disease, CC Turner's syndrome, neurosis, asthma, rheumatoid arthritis, spinal injury, CC acute myocardial infarction, infertility, spinocerebellar degeneration, CC bone fracture, trauma, atopic dermatitis, osteoporosis and/or CC capable of altering the binding activity of the ligand affecting CC capable of altering the binding activity of the ligand affecting activation of the G protein-coupled receptor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Fujii R,

It is useful in the form of drugs for ameliorating, preventing and treating diseases relating to oxytocin secretion e.g. weak pains and atonic bleeding, before and after expulsion of placenta, uterine recovery failure, caesarean section, stoppage of artificial fertilization or galactostasis and is also applicable in veterinary medicine for promoting milk production in cow, goat and pig. This sequence represents a human peptide which acts as an oxytocin secretion
The present sequence describes a method of controlling the secretion controlling the use of a G prote conticotrophin releasing hormone (CRH), involving the use of a G prote receptor ligand. This can be used to control the secretion of CRH and useful as an analyssic or for treating, preventing or ameliorating diseases associated with CRH secretion such as hyperaldosteronism,
                                                                                                                                                                                                                                                                                                                                                                                                                                                            18-NOV-1999;

This sequence represents a novel human type ligand polypeptide encoded CC by pHOB7 which is used in an assay to monitor ligand binding to the GC protein-coupled receptor protein. Pharmaceutical compositions CC containing this ligand may be used as a pituitary function modulator. This CC central nervous system modulator or a pancreatic function modulator. This CC capent for dementia, depression, hyperkinetic syndrome, disturbance of CC consciousness, anxiety syndrome, schizophrenia, trauma, growth hormone CC secretory disease, hyper- and polyphagia, hypercholesterolaemia, the hyperlipidaemia, hyperprolactinaemia, diabetes, cancer, pancreatitis, renal disease, Turner's syndrome, neurosis, cc amylotrophic lateral scierosis, acute myocardial infarction, cc spinocerebellar degeneration, bone fracture, trauma, atopic dermatitis, osteoporosis, asthms, epilepsy, infertility and/or oligogalactis. The present sequence represents a human type ligand polypeptide. The specification describes an agent for modulating prolactin secretion which comprises a ligand polypeptide or a salt, for a 6 protein-coupled receptor (GPCR) protein. The agents for promoting prolactin secretion can be used for treating or preventing hypocovarianism, gonecyst cacogenesis, menopausal syndrome, enthyroid or hypometabolism. They can by used for promoting lactation in a domestic mammal and as an aphrodistac. The agents for inhibiting prolactin secretion can be used for treating or preventing pituitary adenomatosis, brain tumour, emmeniopathy, autolimune disease, prolactinoma, infertility, impotence, amenorihea, gaiactourhea, accomegaly, Chiari-Frommel syndrome, Argonz-de Castilo syndrome, Forbes-Albright syndrome, lymphoma, Sheehan syndrome car dyszoospermia. The inhibitory agents can also be used as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           menopausal syndrome; euthyroid; hypometabolism; lactation; modulation; plituitary adenomatosis; brain tumour; emmenlopathy; autoimmune disease; prolactinoma; infertility; impotence; amenorrhea; galactorrhea; acromegaly; Chiari-Frommel syndrome; Argonz-del Castilo syndrome; Forbes-Albright syndrome; lymphoma; Sheehan syndrome; dygzoospermia; contraceptive; placental function; chorlocarcinoma; hydatid mole; abortion; unthrifty fetus; abnormal saccharometabolism; abnormal lipidmetabolism; oxytocla; prolactin secretion;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 can also be developed to screen compounds which are capable of altering the binding activity of the ligand thus affecting activation of the G protein coupled receptor protein.
                                                                                                                                                                                                                                               Disclosure; Page 158; 24lpp; English.
                                                                                                                                                                                                                                                                              Use of G protein-coupled receptor ligands - for modulating prolactin secretion or placental function, e.g. for treating menopausal syndrome, tumours, autoimmune disease or abnormal pregnancy
                                                                                                                                                                                                                                                                                                                                                       WPI; 1999-105614/09.

```
CC ligand polypeptide corresponding to amino acid residues 34 to 53 of the CS sequence represented in ANW31390 and is used in an assay to monitor CC ligand binding to the G protein-coupled receptor protein. Pharmaceutical compositions containing this ligand may be used as a pituitary function CC modulator. This ligand could have specific applications as a CC prophylactic or therapeutic agent for dementia, depression, hyperkinetic CC syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, CC trauma, growth hormone secretory disease, hyper- and polyphagia, CC hyperipidaemia, hypercholesteroleemia, hypergripycridaemia, compositions, neurosis, asthma, rhemmatoid arthritis, spinal injury, CC Turner's syndrome, neurosis, asthma, rhemmatoid arthritis, spinal injury, CC acute myocardial infarction, infertility, spinocerebeilar degeneration, CC oligopalactia. Assays can also be developed to screen compounds which are capable of altering the binding activity of the ligand affecting CC activation of the G protein-coupled receptor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a human type ligand fragment. It is used in the course of the invention. The specification describes an agent for modulating prolactin secretion which comprises a ligand polypeptide or a salt, for a g protein-coupled receptor (GPCR) protein. The agents for promoting prolactin secretion can be used for treating or preventing hypocovarianism, gonecyst cacogenesis, menapausal syndrome, enthyroid or hypometabolism. They can by used for promoting lactation in a domestic mammal and as an aphrodisiac. The agents for inhibiting prolactin secretion can be used for treating or preventing plactary adenomatosis, brain tumour, emmenlopathy, autoimmune disease, prolactinoma, infertility, impotence, amenorrhea, galactorrhea, acromegaly, Chiarl-Frommel syndrome, Argonz-del Castilo syndrome, erobes-Albright syndrome, lymphoma, Sheehan syndrome or dyszoospermia. The inhibitory agents can also be used as contraceptives. The agents for modulating placental function can be used for treating or preventing chorisospermia, hydatid mode, irruption mode, abortion, unthrifty fetus,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

It is useful in the form of drugs for amediorating, preventing and treating diseases relating to oxytocin secretion e.g. weak pains and atonic bleeding, before and after expulsion of placenta, terrine recovery failure, csessresn section, stoppage of artificial fertilization or gaiactostasis and is also applicable in veterinary medicine for promoting milk production in cow, goat and pig. This sequence represents a human peptide which acts as an oxytocin secretion
The invention provides a monoclonal antibody which has a specific reaction with the part peptide of the C-terminal of 1992 ligand or its derivative. The antibodies can be used in diagnosis or to treat or prevent diseases associated with abnormality in the pituitary function regulatory mechanism (e.g. promotion of prolactin secretion), central mervous regulatory mechanism, and pancrestic function regulatory mechanism. The antibody-based immunosassy can slso be applied in clarifying the physiological functions of the ligand and its derivative sequences ANY49290-302 represent peptide fragments of the 1992 ligand.

                                                                                                                               The present sequence describes a method of controlling the secretion of corticotrophin releasing hormone (CRH), involving the use of a G protein receptor ligand. This can be used to control the secretion of CRH and is useful as an analgesic or for treating, preventing or smellorating diseases associated with CRH secretion such as hyperaldosteronism, hypercortisolaemia, secondary or chronic hypoadrenocorticism, Addison's disease (including horedom, nausea, pigmentation, hypogonadism, hair loss, and hypotension), adrensi giand hypofunction and obesity. The present sequence is a peptide used in the exemplification of the

                                                                                                                                                                                                                                                              The present invention describes a modified therapeutic peptide (I) C comprising a therapeutically active amino acid region (III) and a CC reactive group (II) (e.g. succinimidy) and maleimido groups) attached to CC a less therapeutically active amino acid region (IV), which covalently CC bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. CC (1) are useful for modifying therapeutic peptides e.g. hormones, growth CC factors and neurotransmitters, to protect them from peptidase activity CC in vivo for the treatment of various disorders. Endogenous therapeutic CC administration due to rapid degradation by peptidases in the body. CC Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (haif CC infe) and specificity as bonding to large molecules decreases (CC intracellular uptake and interference with physiological processes. CC AAB90829 to AAB92441 represent peptides which can be used in the creative contracellular interference with physiological processes.

                                                                                                              á
                                                                                                                                                                                                                             CC This sequence represents a peptide fragment from a novel human type CC ligand polypeptide corresponding to amino acid residues 34 to 54 of the CC sequence represented in AAW31390 and is used in an assay to monitor CC ligand binding to the G protein-coupled receptor protein. Pharmaceutical CC compositions containing this ligand may be used as a pituitary function CC modulator, a central nervous system modulator or a pancreatic function CC modulator. This ligand could have specific applications as a CC prophylactic or therapeutic agent for dementia, depression, hyperkinetic construence, disturbance of consciousness, anxiety syndrome, schizophrenia, CC trauma, growth hormone secretory disease, hyper- and polyphagia, CC hyperlipidaemia, hypercholesterolaemia, hyperglyceridaemia, hypercholesterolaemia, hyperglyceridaemia, figure, CC Turner's syndrome, neurosis, asthma, rheumatoid arthritis, spinal injury, cransient brain ischaemia, epilepsy, amylotrophic lateral sclerosis, acute myocardial infarction, infertility, spinocerebeilar degeneration, CC bone fracture, trauma, atopic dermatitis, osteoporosis and/or cligogalactia. Assays can also be developed to screen compounds which are capable of altering the binding activity of the ligand affecting activation of the G protein-coupled receptor protein.

                                                                                                                                                                                                                                                                                                                                           This invention describes a novel oxytocin secretion-regulating agent which contains a ligand peptide or its sait for the G protein-coupled receptor protein. It is useful in the form of drugs for ameliorating, preventing and treating diseases relating to oxytocin secretion e.g. weak pains and atonic bleeding, before and after expulsion of placenta, uterine recovery failure, caesarean section, stoppage of artificial fertilization or galactostasis and is also applicable in veterinary medicine for promoting milk production in cow, goat and pig. This sequence represents a human peptide which acts as an oxytocin secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Physiologically-active polypeptide recognized as ligand by G protein-coupled receptor protein, for promoting secretion of oxytocin, protein-coupled receptor protein, for promoting secretion and in veterinary and drugs for diseases relating to oxytocin secretion and in veterinary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI;

This can be used to control the secretion of CRH and is useful as an analysis or for treating, preventing or ameliorating diseases associated with CRH secretion such as hyperaidosteronism, hypercortisolaemia, secondary or chronic hypeadrencorticism, Addison's disease (including boredom, nauses, pigmentation, hypogonadism, hair loss, and hypotension), adrenal gland hypofunction and obesity. The present sequence is a peptide used in the exemplification of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    멍
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      sequence represented in ARMINION and is used in an assay to monitor colligion binding to the G protein-coupled receptor protein. Pharmaceutical compositions containing this ligand may be used as a pituitary function modulator, a central nervous system modulator or a pancreatic function composition. This ligand could have specific applications as a prophylactic or therapeutic agent for dementia, depression, hyperkinetic cyndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, trauma, growth hormone secretory disease, hyper- and polyphagia, cynyperprolactinaemia, hypercholesterolaemia, hypercylocaridaemia, cynypercylocaridaemia, cynypercylocaridaemia, cynypercylocaridaemia, cynypercylocaridaemia, hypercylocaridaemia, hypercylocaridaemia, hypercylocaridaemia, hypercylocaridaemia, cynypercylocaridaemia, cynypercylocaridaemi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          which contains a ligand peptide or its salt for the G protein-coupled receptor protein. It is useful in the form of drugs for ameliorating, preventing and treating diseases relating to oxytoch secretion e.g. weak pains and atonic bleeding, before and after expuision of piacenta, uterine recovery failure, caesarean section, stoppage of artificial fertilization or galactostasis and is also applicable in veterinary medicine for promoting milk production in cow, goat and pig. This sequence represents a human peptide which acts as an oxytocin secretion
                                                                                                                            Use of G protein receptor ligand or peptide corticotropin releasing hormone secretion -
                                                                                                                                                                                  Kitada C,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
```

The present sequence describes a method of controlling the secretion of corticotrophin releasing hormone (CRH), involving the use of a G proteir receptor ligand. This can be used to control the secretion of CRH and is useful as an analgesic or for treating, preventing or smellorating diseases associated with CRH secretion such as hyperaidosteronism, hypercortisolaemia, secondary or chronic hypoadrencorticism, Addison's disease (including boredom, nausea, pigmentation, hypogonadism, hair loss, and hypotension), adrenal gland hypofunction and obesity. The present sequence is a peptide used in the exemplification of the

protein H and is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    믕
CC This sequence represents a peptide fragment from a novel human type CC ligand polypeptide corresponding to amino acid residues 23 to 53 of the CC sequence represented in AAW31390 and is used in an assay to monitor CC digand binding to the G protein-coupled receptor protein. Pharmaceutical CC compositions containing this ligand may be used as a pituitary function CC modulator. This ligand could have specific applications as a CC prophylactic or therapeutic agent for dementia, depression, hyperkinetic syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, CC syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, CC trauma, growth hormone secretory disease, hyper- and polyphagia, CC hyperlipidaemia, hypercholesterolaemia, hyperglyceridaemia, thypergrolactinaemia, diabetes, cancer, pancreatitis, renai disease, CC Turner's syndrome, neurosis, asthma, rheumatoid arthritis, spinal injury, CC translent brain ischaemia, epilepsy, amylotrophic lateral sclerosis, acute myocardial infarction, infertility, spinocerebellar degeneration, CC bone fracture, trauma, atopic dermatitis, osteoporosis and/or CC capable of altering the binding activity of the ligand affecting CC activation of the grotein-coupled receptor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            18-SEP-1996;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sox
          The present sequence represents a human type ligand fragment. It
CC is used in the course of the invention. The specification describes
CC an agent for modulating prolactin secretion which comprises a
CC ligand polypeptide or a salt, for a G protein-coupled receptor (GPCR)
CC protein. The agents for promoting prolactin secretion can be used for
CC treating or preventing hypocovarianism, genecyst cacogenesis, menopausai
CC syndrome, euchyroid or hypometabolism. They can by used for promoting
CC inhibiting prolactin secretion can be used for treating or preventing
CC inhibiting prolactin secretion can be used for treating or preventing
CC prolactinoma, infertility, impotence, amenorrhea, galactorrhea,
CC prolactionma, infertility, impotence, amenorrhea, galactorrhea,
CC prolactions, infertility impotence, amenorrhea galactorrhea,
CC prolactions, infertility syndrome, Argonz-del Castilo syndrome,
CC prolactions, infertility syndrome, Argonz-del Castilo syndrome,
CC prolactions of the syndrome of the syndrome of the agents for
CC comegaly, Chiari-Frommel syndrome, Argonz-del Castilo syndrome,
CC comegaly, Chiari-Frommel syndrome, Argonz-del Castilo syndrome,
CC controlactions, hydrome, lymphoma, Sheehan syndrome or dyszoospermia.
CC controlactions, hydrome, hydrome, about on mole, about on mole, about of treating or preventing
CC chorres agents and about a horrary includes the syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches

 Thia is the amino acid sequence of the human pituitary G commercial high-level production of 1992L comprises expressing CC the ligand in host ceils as a recombinant fusion protein e.g. with CC human basic fibroblast growth factor (see AAV83796-97) that has CC been modified to include an N-terminal cysteine residue. The CC high doses protactin secretion setimulating and (at CC high doses) protactin secretion-inhibiting properties. It can be CC used in the treatment and prevention of various diseases including: CC with: genealogical disorders (e.g. Alzheimer's disease, Parkinson's CC disease, Pick's disease, Huntington's disease), infectious diseases (e.g. Creutzfeidt-Jakob's), endocrine or metabolic disease or cc diseases (e.g. bypothyroidism, vitamin B12 deficiency, alcoholism, CC intoxication by druga, metal and organic compounds), tumourigenic CC subarachnoidal heamorrhage, and other types of dementia, derpession, CC hyperactive child syndrome (microencephalopathy) and disturbance of CC consciousess. It is also useful for prevention and treatment of CC disease associated with prolactin hypo and hypersecretion consciousness. It is also useful for prevention and treatment of CC disease consciousness. It is also useful for prevention and treatment of CC disease associated with prolactin hypo and hypersecretion consciousness. It is also useful for prevention and treatment of CC disease associated with prolactin hypo and hypersecretion consciousness. It is also useful for prevention and treatment of CC disease associated with prolactin hypo and hypersecretion disease in the consciousness of the consciousness. It is also useful for hyporal action hypersecretion consciousness is considered with prolactin hypo and hypersecretion consciousness.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence represents a peptide fragment from a novel human type ligand polypeptide corresponding to mainto acid residues 34 to 53 of the sequence represented in AAR31390 and is used in an assay to monitor ligand binding to the 6 protein-coupled receptor protein. Pharmaceutical compositions containing this ligand may be used as a pituitary function modulator. This ligand could have specific applications as a prophylactic or therapeutic agent for dementia, depression, hyperkinetic appropriate the formal prophylactic or therapeutic agent for dementia, depression, hyperkinetic appropriate the formal prophylactic or therapeutic agent for dementia, depression, hyperkinetic appropriate the formal prophylactic or therapeutic agent for dementia, depression, hyperkinetic appropriate the formal prophylactic or therapeutic agent for dementia, depression, hyperkinetic appropriate the formal prophylactic or therapeutic agent for dementia depression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human type ligand polypeptide fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAW97236 standard; peptide;

It is used in the course of the invention. The specification describes a nagent for modulating prolactin secretion which comprises a company of the invention. The specification describes can agent for modulating prolactin secretion which comprises a company of the agents for promoting prolactin secretion can be used for treating or preventing hypovarianism, genecyst cacogenesis, menopausai syndrome, euchyroid or hypometabolism. They can by used for promoting conhibiting prolactin secretion can be used for treating or preventing conhibiting prolactin secretion can be used for treating or preventing conhibiting prolactin secretion can be used for treating or preventing confusion, infertility, impotence, amenorrhea, gainctorrhea, caromegaly, Chiari-Frommei syndrome, Argonz-del Castilo syndrome, can also be used as contraceptives. The agents for modulating placental function can be used for treating or preventing conducating placental function can be used for treating or preventing conducation and hydatid mole, irruption mole, abortion, unthrifty fetus, abortion, abortion, unthrifty fetus, abortion is acceptable.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

by cleavage dementla,

This sequence represents a peptide fragment from a novel rat type illgand polypeptide corresponding to amino acid residues 22 to 52 of the aequence represented in AMM31383 and is used in an assay to monitor ligand binding to the G protein-coupled receptor protein. Pharmaceutical compositions containing this ligand may be used as a pitultary function modulator. This ligand could have specific applications as a prophylactic or therapeutic agent for dementia, depression, hyperkinetic appropriation or therapeutic agent for dementia, depression, hyperkinetic Ligand peptide for G protein-coupled receptor - acts by modulating function in the central nervous system, pancreas and pituitary gland 2 Page 179; 258pp; English.

syndrome, disturbance of consciousness, anxiety syndrome, achizophrenia, trauma, growth hormone secretory disease, hyper- and polyphagia, hyperlipidaemia, hyperchoiesterolaemia, hypergrotactinaemia, diabetes, cancer, pancreatitis, renal disease, hyperproductinaemia, diabetes, cancer, pancreatitis, renal disease, transient brain ischaemia, epilepsy, amylotrophic lateral aclerosis, acute myocardial infarction, infertility, spinocerebellar degeneration, bone fracture, tranma, atopic dermatitis, osteoporosis and/or oligogalactia. Assays can also be developed to screen compounds which are capable of altering the binding activity of the ligand affecting activation of the G protein-coupled receptor protein.

XX Thei CC is used in the course of the invention. The specification describes CC an agent for modulating prolactin secretion which comprises a CC ligand polypeptide or a sait, for a g protein-coupled receptor (GPCR) CC protein. The agents for promoting prolactin secretion can be used for creating or preventing hypocovarianism, gonecyst cacogenesis, menopausal CC syndrome, euthyrold or hypometabolism. They can by used for promoting CC lactation in a domestic mammal and as an aphrodisiac. The agents for CC inhibiting prolactin secretion can be used for treating or preventing CC prolactinoma, infertility, impotence, amenorate, autoimmune disease, CC acromegaly, Chiari-Frommel syndrome, Argonz-del Castilo syndrome, CC acromegaly, Chiari-Frommel syndrome, Argonz-del Castilo syndrome, CC The inhibitory agents can also be used for treating or preventing CC modulating placental function can be used for treating or preventing CC choriocarcinoma, hydatid mole, irruption mole, abortion, unthrift forms. 밁 Ş Query Match Best Local Matches Producing a 19P2 pituitary G protein receptor ligand of a fusion protein, useful for preventing and treating breast cancer, renal failure and autoimmune disease WPI; 1999-047884/05 Morlya T, 25-JUN-1998; 30-DEC-1998 Use of G protein-coupled receptor ligands - for modulating prolactin secretion or placental function, e.g. for treating menopausal syndrome, tumours, autoimmune disease or abnormal pregnancy (TAKE ) TAKEDA 27-JUN-1997; EP887417-A2 Rattus sp. therapy. 1992 ligand; G protein coupled receptor; pituitary; prolactin releasing peptide; rat; dementia; breast Rat 19P2 ligand 29-MAR-1999 AAW87614; AAW87614 standard; Peptide; 31 Sequence Claim 3, WPI; 1999-105614/09 1 SRXHXHSMEXR 11 w arahqhsmetr 11 8 Slmllarity Page 153; 24lpp; English Nishimura 31 Conservative (firat entry) ξ

This sequence represents a peptide fragment from a novel human type CC ligand polypeptide corresponding to annotate residues 23 to 53 of the Sequence represented in AAW31390 and is used in an assay to monitor CC ligand binding to the G protein-coupled receptor protein. Pharmaceutical CC compositions containing this ligand may be used as a pituitary function CC modulator, This ligand could have specific applications as a prophylactic or therapeutic agent for dementia, depression, hyperkinetic CC syndrome, disturbance of consciousness, anxiety syndrome, schizophrenia, trauma, growth hormone secretory disease, hyper-and polyphagia, CC hyperlipidaemia, hyperchoiesterolaemia, hyperchoiesterolaemia, hyperphagia, CC hyperlipidaemia, diabetes, cancer, pancreatitis, renai disease, CC Turner's syndrome, neurosis, asthma, rheumatold arthritis, spinal injury, cacute myocardiai infarction, infertility, spinocerebellar degeneration, CC done fracture, trauma, atopic dermatitis, osteoporosis and/or capable of altering the binding activity of the ligand affecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ciaim 2;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ligand peptide for G protein-coupled receptor - acts by modulating function in the central nervous system, pancreas and pituitary gland
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Page

Ligand peptide for G protein-coupled receptor - acts by modulating function in the central nervous system, pancreas and pituitary gland

Claim 2; Page 179; 258pp; English.

cc modulator. This ligand could have specific applications as a probability or therapeutic agent for dementia, depression, hyperkinetic cyrophylactic agent for dementia, depression, hyperkinetic cyrophylactic agent for consciousness, anxiety syndrome, schizophrenia, cyrowth hormone secretory disease, hyper- and polyphagia, cyroperipidaemia, hypercholesterolaemia, hyperglyceridaemia disease, cyroperipidaemia, hypercholesterolaemia, hyperglyceridaemia injury, cyroperipidaemia, hypercholesterolaemia, hyperglyceridaemia, spinal injury, cyropersyndrome, neurosis, astima, rheumatoid arthritis, spinal injury, cyroperipidaemia ischaemia, epilepsy, amylotrophic lateral sclerosis, cyroperipidaemia, epilepsy, amylotrophic lateral degeneration, compounds which are colloqualactia. Assays can also be developed to screen compounds which are compounds of attering the binding activity of the ligand affecting constitution of the G protein-coupied receptor protein. ligand polypeptide corresponding to amino acid residues 22 to 52 of the sequence represented in AAW31383 and is used in an assay to monitor ligand binding to the G protein coupled receptor protein. Pharmaceutical compositions containing this ligand may be used as a pituitary function This sequence represents a peptide fragment from a novel rat ligand polypeptide corresponding to amino acid residues 22 to Pharmaceutical

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

function in the centr

```
cc sequence represented in AAW31390 and is used in an assay to monitor cc ligand binding to the G protein-coupled receptor protein. Pharmaceutical compositions containing this ligand may be used as a pituitary function cc modulator. This ligand could have specific applications as a proposition correction cc modulator. This ligand could have specific applications as a proposition containing this ligand may be used as a pituitary function cc modulator. This ligand could have specific applications as a proposition could have specific applications as a proposition of the prophylactic or therapeutic agent for dementia, depression, hyperkinetic cc trauma, growth hormone secretory disease, hyper- and polyphagia, cc hyperipidaemia, hypercholesterolaemia, hypergriveridaemia, collegand, consciptional injury, cc hyperprolactinaemia, diabetes, cancer, pancreatitis, renal disease, cc hyperprolactinaemia, neurosis, asthma, rheumatoid arthritis, spinal injury, cacute myocardial infarction, infertility, spinocarebellar degeneration, cc oligogalactia, Assays can also be developed to screen compounds which are capable of altering the binding activity of the ligand affecting cc activation of the G protein-coupled receptor protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAW87615
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents a human type ligand fragment. It

CL is used in the course of the invention. The specification describes

CL an agent for modulating prolactin secretion which comprises a

CL ligand polypeptide or a salt, for a G protein coupled receptor (GPCR)

CL protein. The agents for promoting prolactin secretion can be used for

CL treating or preventing hypocovarianism, gonecyst cacogenesis, menopausal

CL syndrome, euthyroid or hypometabolism. They can by used for promoting

CL inhibiting prolactin secretion can be used for treating or preventing

CL inhibiting prolactin secretion can be used for treating or preventing

CL prolactinoma, infertility, impotence, amenorrhea, galactorrhea,

CL prolacting and produced syndrome, Argonz del Castilo syndrome,

CL concegaly, Chiari-Frommel syndrome, Argonz-del Castilo syndrome,

CL prolacting placental function can be used for treating or preventing

CL modulating placental function can be used for treating or preventing

CL choornel syndrome, hydatid mole, irruption mole, abortion, unthrifty fetus,

CL choornel agents for the syndrome or dyszoospernia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches 31;
